

SPE Scholarship

Being part of the Petroleum industry is one of the ultimate goals of Chemical Engineering students and I fortunately have the greatest golden opportunity to be awarded and participate SPE Thailand scholarship. During the scholarship program, I gained not only educational support, but also the chance to use my potentiality and the network of people in petroleum industry via creating the project of student field trip. From being one of staffs in the SPE Petroleum field trip for university students, I have learned many things. For example, when I prepared the contents to use in the trip, I have known more about petroleum industry and technologies that I have not studied in the department of Chemical Engineering (especially exploration and production of petroleum). These knowledge significantly influence me to desire to work in petroleum industry. Moreover, another learning is about social skill. To make the field trip, I have to present the proposal of the trip to SPE boards. To connect with other students from different university and department, I have to use communication skill to make them interest in the activity. These are only several examples. In fact, SPE scholarship gave me many great experiences that I have not found in other places.

In short, I would like to encourage students who study in the department related to petroleum or geology to participate the SPE scholarship program in order to closely relate to petroleum industry and to improve your ability, making 'the best in you'.
